

Checklist:

10 Ways To Check The Efficiency Of Your Mixed Industrial Fleet

**Does your rental, dealership,
or construction company have
the tools to succeed in the USA
in 2022?**

Complete the checklist and learn
how technology can save your
business time and money.

I know the exact location of my machines, in real time.

With GPS tracking, you can find each machine quickly for pick-up at the end of a rental period, site visit, or for maintenance, even when the machine is not in operation.

I have accurate information for billing.

With the real-time monitoring of machines, you have accurate data to communicate with your customers about usage so you can maximise rental or sub-leasing incomes.

My machines never “disappear”.

Geofencing technology allows you to set virtual boundaries and receive immediate notifications if a machine exceeds your set limits.

I always have all the data I need to insure my machine.

Data provided by telematics systems, such as geofencing or location history, means you have instant evidence for insurance cover in case of theft.

I have the insights to invest (and disinvest) machines.

With telematics usage reporting, you see which machines are used most often in which locations (and which aren't) for optimal fleet composition.

I always avoid the undesired sub-letting of my machines.

Track-and-trace functionalities such as location history ensure you know that your machines are not being used anywhere else without your knowledge.

I receive notifications when machines need periodic maintenance.

Automatic service estimation notifications save your technicians precious time on periodic maintenance and provide them with all the information they need for a quick and accurate intervention.

I have very few machine breakdowns.

By enabling preventative maintenance through functionalities such as impact detection and asset utilisation, you can minimise breakdowns and downtime.

I maximise the number of clients I can service each day

Remote diagnostics enable you to service more rental customers, dealership clients, or construction partners in a more efficient manner.

I avoid the unnecessary wear of my industrial batteries

By monitoring various parameters on your expensive industrial batteries, you can maximise their charge cycles and prolong battery lifespan.

We deliver a system that meets your company's needs today and responds to the challenges your business will face tomorrow.

Discover how GemOne telematics can make your industrial fleet safer and more efficient.
